Art Unit: 3729

The Final Rejection which was mailed on or about 03 July 2006 has been reopened in favor the following **non-Final Office Action**. Any inconvenience is hereby regretted.

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 11-15 are rejected under 35 U.S.C. 102(b) as being anticipated by Japan Pat No. 01-274, 440; hereinafter Eto, of Record.

This teaching speaks for itself. Additionally, the Office has carefully outlined each of the elements in this teaching which responds to the method steps recited in the claimed invention. That is, Eto teaches placing a first surface of the lead frame base tape 7a onto a leadframe 5 and the second surface of the base tape onto a porous block (9a). Eto teaches *inter alia* applying a vacuum on the heater block in order to cause the lead frame to be secured to the work holder. The attitude or holding of the Office with respect to claim 1 and more specifically to the element "lead frame base tape" (in claim 1) is that the element 7a (heater plate) which also can be and is construed to be a lead frame base tape. (N.B. According to *Webster's Third New International Dictionary* "tape" can mean *inter alia* a narrow limp or flexible strip or band (as of paper, plastic or metal). With respect to claim 12 Eto teaches that the pore diameter is about 10 microns (which is less than 2 mm (which number is expressly taught by Eto)). Eto also teaches applying chips to the lead frame's second surface and

Art Unit: 3729

(Cf. e.g. Fig. 1) and providing wire bonding to a chip. (Note: In this Office Action a full English translation of the Eto document is provided.) With respect to Applicants' claim 14 wherein the porous block 7a is heated it is deemed that the heating or metal plate part i.e. element 10 will heat the porous block and hence the limitation in claim 14 is met.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 16 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Eto. The Eto teaching does not specifically disclose that there is a predetermined density of holes for the vacuum. e.g. 3 holes/square centimeter. It is held, however, that this density (claim 16) and ratio (claim 17) would have been obvious a PHOSITA to provide and that the density claimed would be obtained merely with the use of ordinary skill in this art. Alternatively it is held that these limitations are a mere matter for design choice inasmuch as no specific problems have been solved nor are these limitations for any particular purposes.

Claims 20-22 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
